

RMS TITANIC: EXECUTIVE DEMOGRAPHIC & SURVIVAL INTELLIGENCE

An analytical post-mortem of passenger demographics, socioeconomic stratification, and the defining variables of survival.

TOTAL RECORDS ANALYZED: 891 | STATUS: DECLASSIFIED

The Bottom Line: Mission Overview

Total Passengers

891

Total Survivors

342

Overall Survival Rate

38.38%

Average Fare Paid

£ 32.20

The Manifest: Points of Origin

Cherbourg
(168 Passengers | 18.86%)

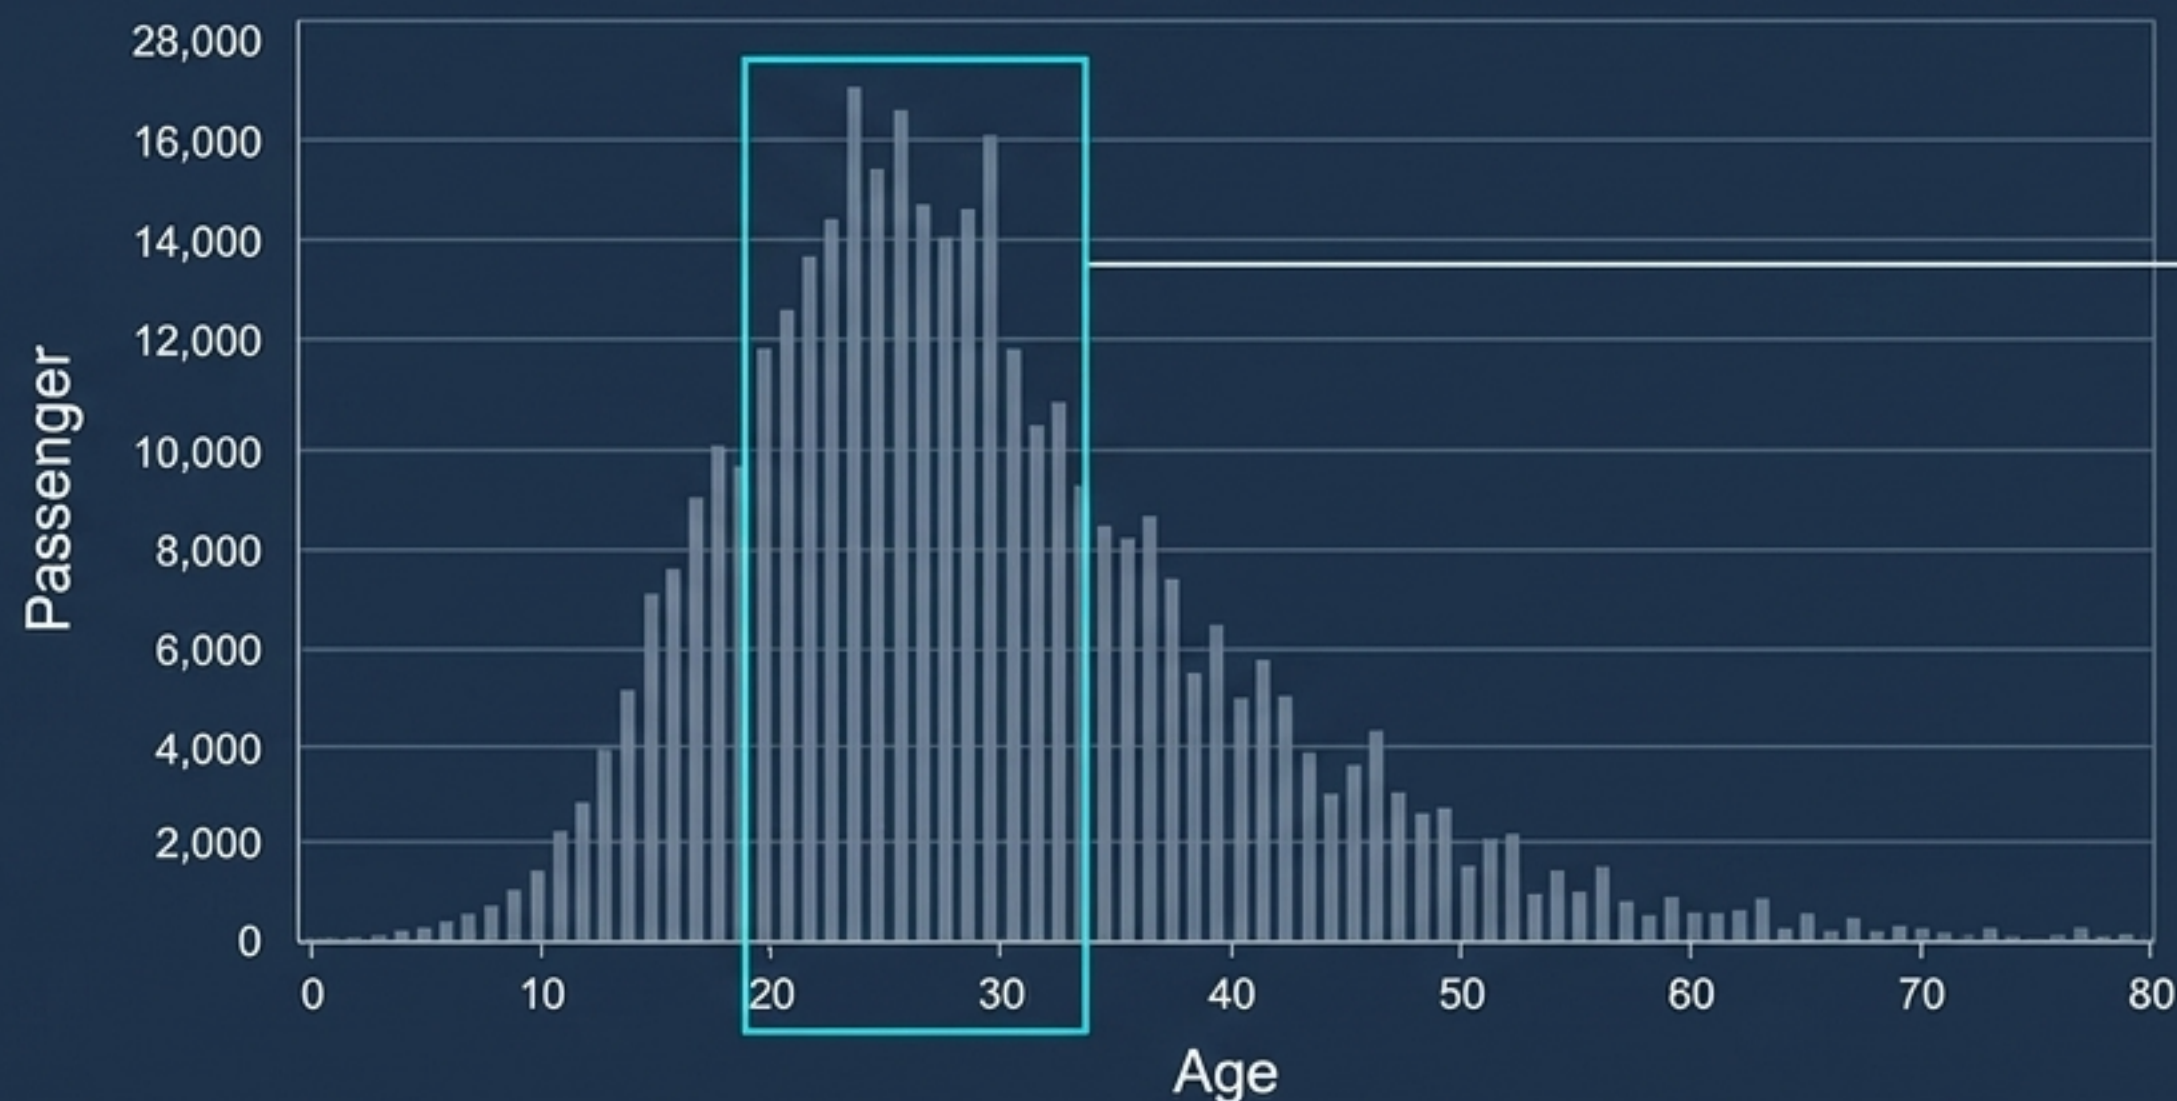

Queenstown
(Remaining %)

The Manifest: Demographic Distribution

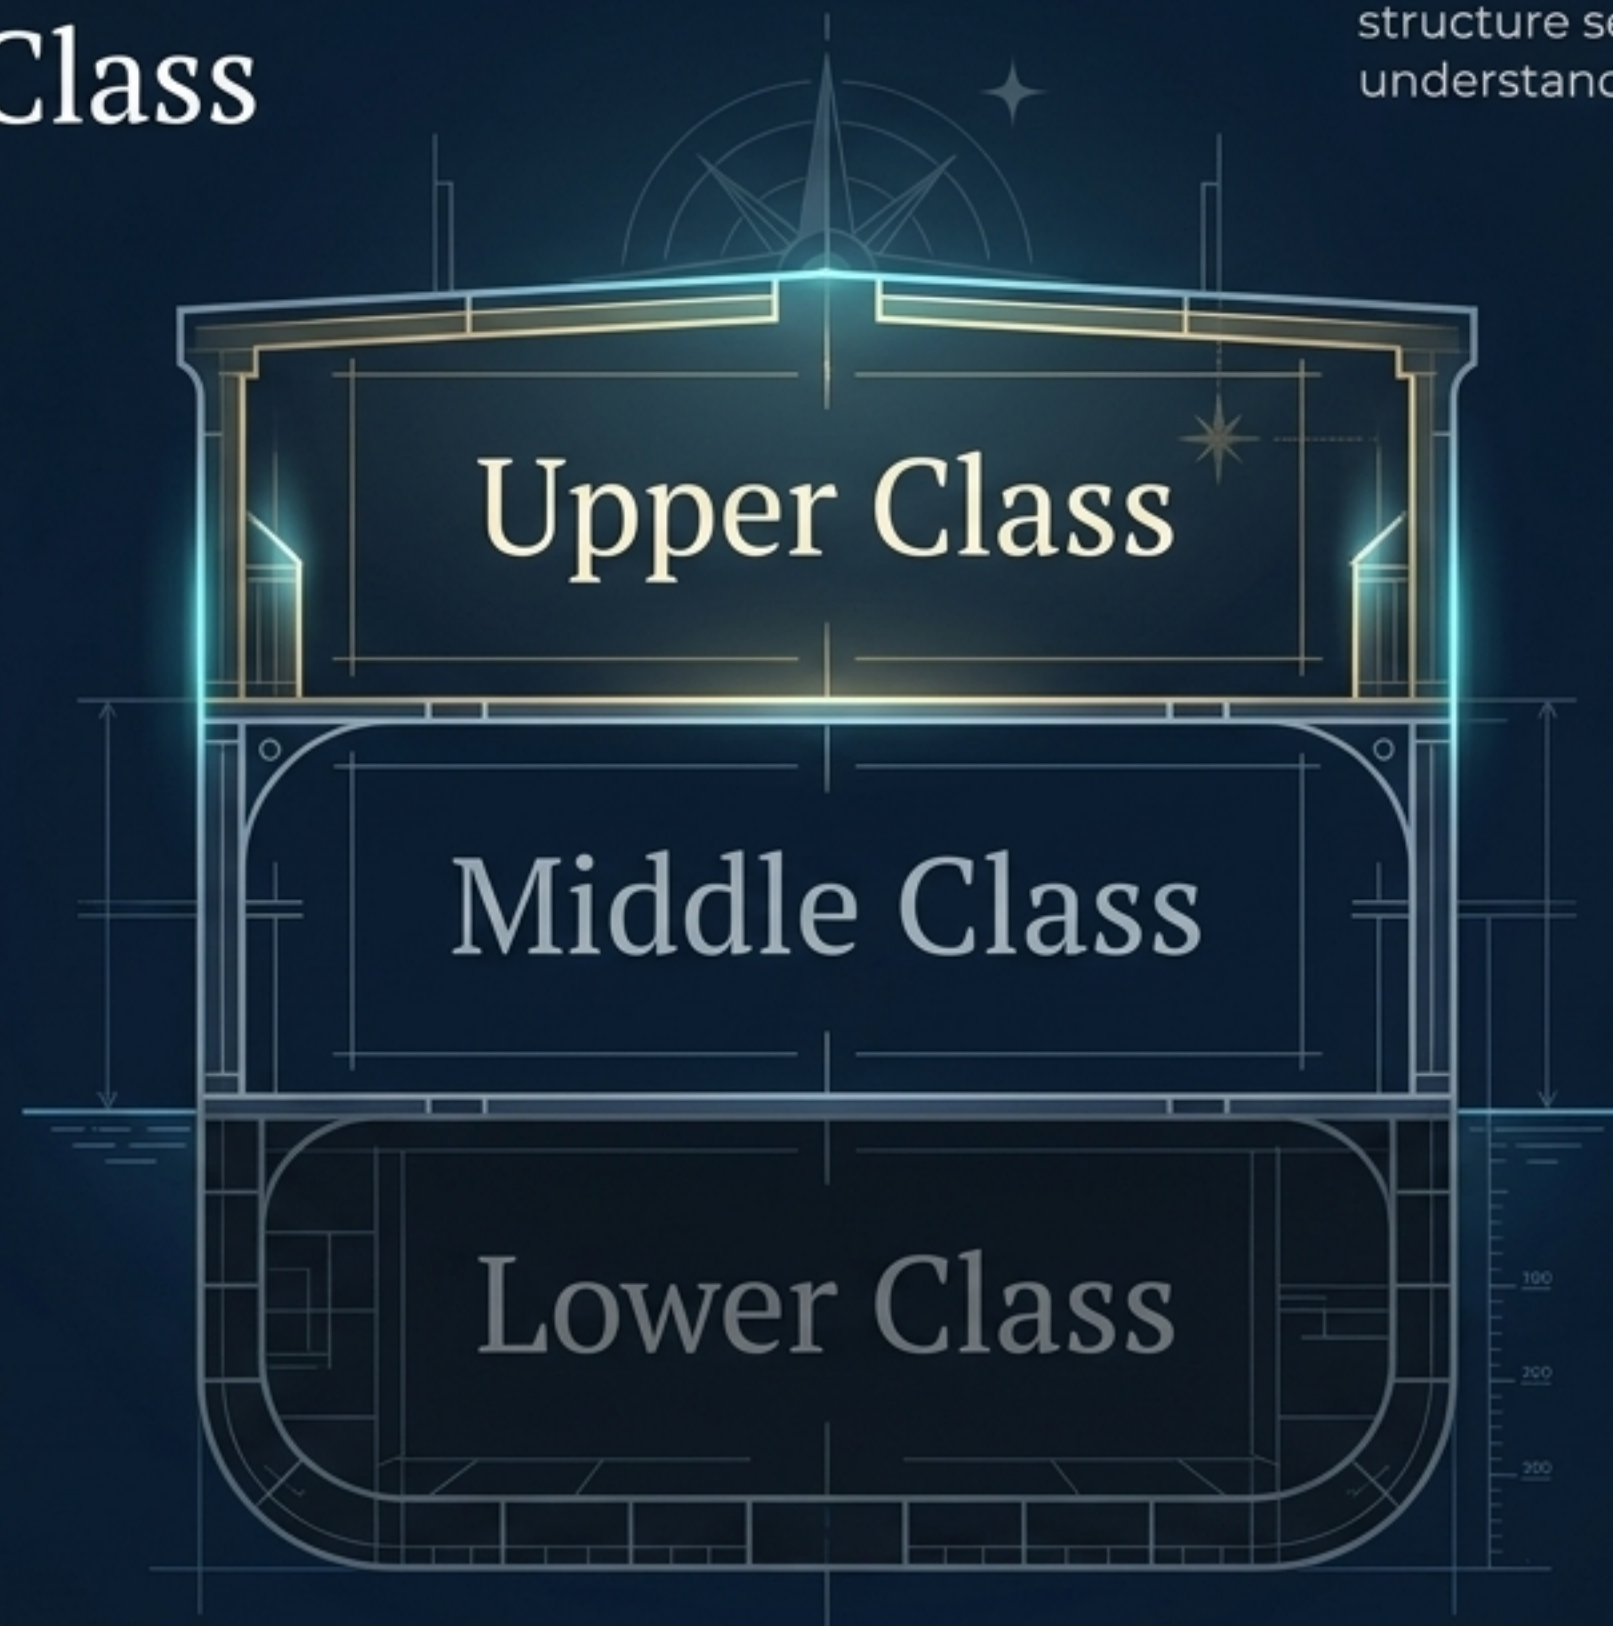

Heavy Male Skew: The baseline population was overwhelmingly male, setting a critical context for later survival protocols.

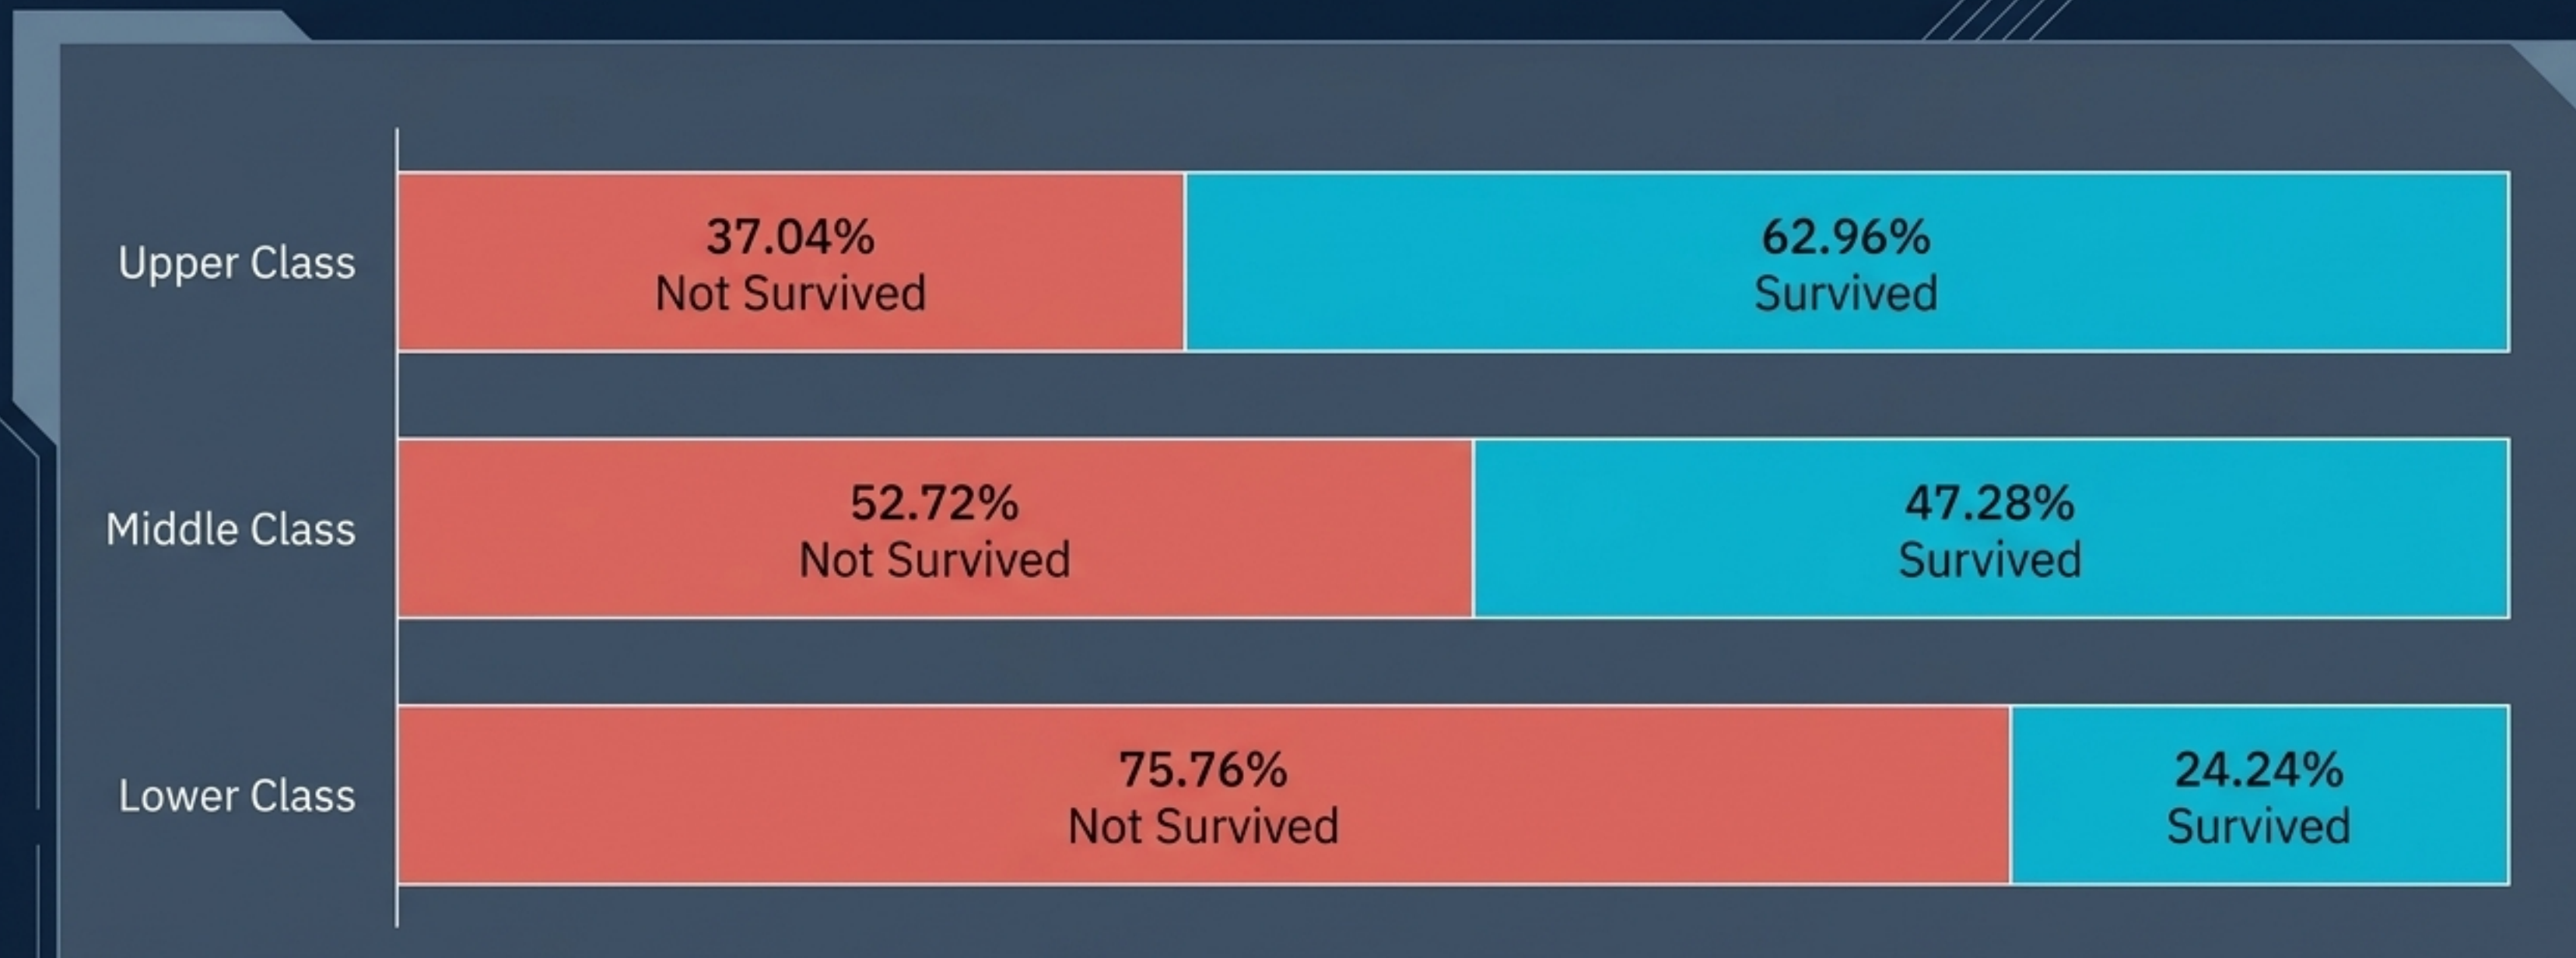

→ **The 20-30 Concentration:**
The peak density of passengers fell squarely in young adulthood.

The Social Divide: Passengers by Class

The passenger manifest was strictly segregated into a socioeconomic hierarchy. This three-tiered structure serves as the primary analytical lens for understanding the survival outcome disparities.

Key Driver 1: The Socioeconomic Impact on Survival

Insight The survival matrix flips entirely between the Upper and Lower classes. Wealth was a definitive predictive variable.

Key Driver 2: Gender Dynamics (“Women and Children First”)

Insight Despite the ship's demographic makeup being heavily skewed toward men, the strict enforcement of historical maritime emergency protocols resulted in a massive inversion of survival probability when filtered by Sex.

Data in Action: Passenger Profiles

PASSENGER PROFILE

SURVIVED

Passenger ID: 2
Name: Mrs. John Bradley Cumings
(Florence Briggs Thayer)
Class: 1 (Upper)
Sex: Female
Age: 38

Profile Note: High-probability
archetype.

PASSENGER PROFILE

NOT SURVIVED

Passenger ID: 1
Name: Mr. Owen Harris Braund
Class: 3 (Lower)
Sex: Male
Age: 22

Profile Note: Low-probability
archetype.

Synthesis: The Survival Probability Matrix

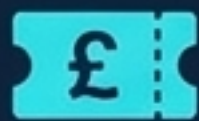

High Probability Profile

Class: Upper Class

Gender: Female

Ticket: Above Average Fare
(> £32.20)

Low Probability Profile

Class: Lower Class

Gender: Male

Ticket: Below Average Fare

Survival was deeply systemic, requiring specific combinations of demographic and socioeconomic advantages.

Executive Intelligence Summary

The tragic outcome of the RMS Titanic was not merely a random catastrophic event, but a strict reflection of early 20th-century societal stratification. The data conclusively proves that in the face of disaster, survival was dictated primarily by a passenger's class and gender.
